

Sharing During Installation

Installing a shared application tier file system with 11.5.10.2 Rapid Install

1. Determine the shared file system mount points. Rapid Install must be able to access the file system from the same mount point on all the application tier nodes. For example:

- * Shared COMMON_TOP: /d01/shared_mount/viscomn
- * Shared APPL_TOP: /d01/shared_mount/visappl
- * Shared 806 ORACLE_HOME: /d01/shared_mount/visora/8.0.6
- * Shared iAS ORACLE_HOME: /d01/shared_mount/visora/iAS

Sharing During Installation

2. Specify mount points in Rapid Install When prompted by the Rapid Install wizard, define the paths to be shared to be the same for each node in the 11i Applications system.

The following paths must be the same on each node where the Rapid Install is executed:

- * APPL_TOP
- * COMMON_TOP
- * 8.0.6 ORACLE_HOME
- * iAS 1.0.2.2.2 ORACLE_HOME
